

FlexineboTMsa

Fast, Portable,
Versatile
Small Animal
Nebulisation
Device

What is Nebulisation?

Nebulisation is a treatment technique in which tiny spherical droplets of aerosolised medication are generated and inhaled by the patient animal.

Why use a Nebuliser?

A nebuliser device enables the small animal owner to easily administer care to their pet's airways and lungs. The device incorporates a mask that fits on the nose and a technological means of generating a fine mist.

Why Flexineb_{SA}?

- Flexineb_{SA} is a fully integrated nebulisation system designed to treat a number of respiratory diseases in small animals including cats, dogs, rodents, reptiles and birds.
- Flexineb_{SA} incorporates the same vibrating mesh nebulisation technology used in Nortev's award winning Flexineb™ equine nebuliser.

- Flexineb_{SA} can be used to treat a number of conditions such as feline asthma and allergic rhinitis in cats and chronic bronchitis and laryngeal paralysis in dogs. Flexineb_{SA} can also be used to treat a number of respiratory infections associated with small animals.
- You can use a wide range of drugs with Flexineb_{SA} including antibiotics, bronchodilators, steroids and mucolytics. You can also use non-drug based solutions such as saline.
- The Flexineb_{SA} has 2 types of interface to treat your pet. The first uses soft silicone masks as the interface between the nebuliser and patient. This makes the treatment portable. These silicone masks come in 3 sizes, (small, medium and large) to suit all patient types.
- The second interface is a small animal aerosol treatment chamber. This can be used for cats and small dogs that are unwilling to be treated using the silicon mask interface. The treatment chamber can also be used to treat a number of other small animals including rabbits, guinea pigs, birds and tortoises.

1

Portable, easy to assemble system

2

Battery operated controller

3

Medication cup and handheld spacer
